

Algae and Bubbler

Fresh Org forwarded your question about algae to their scientists. Their scientists conducted the following experiment. They placed algae in two tanks, one with a bubbler and one without. They also had a control tank with no algae and no bubbler.

Tank 1 -- no algae and no bubbler.

Tank 2 -- lots of algae and no bubbler.

Tank 3 -- lots of algae and a bubbler.

Note: they did not put any fish in these tanks.

They measured the oxygen level at the start of the experiment, it was 9.5 in all tanks. They measured the oxygen levels again after 2 days.

The diagram below shows how much dissolved oxygen was in each tank.
